Executive Summary

SpaceX Falcon 9 first stage Landing Prediction

- Summary of methodologies
- Summary of all results

Introduction

- Let's predict if the Falcon 9 first stage will land successfully. SpaceX advertises Falcon 9 rocket launches on its website with a cost of 62 million dollars; other providers cost upward of 165 million dollars each, *much of the savings is because SpaceX can reuse the first stage*. Therefore **if we can determine if the first stage will land, we can determine the cost of a launch**.
- Let's collect and make sure the data is in the correct format from API in order to reaching a success result.

Section 1

Methodology

Methodology

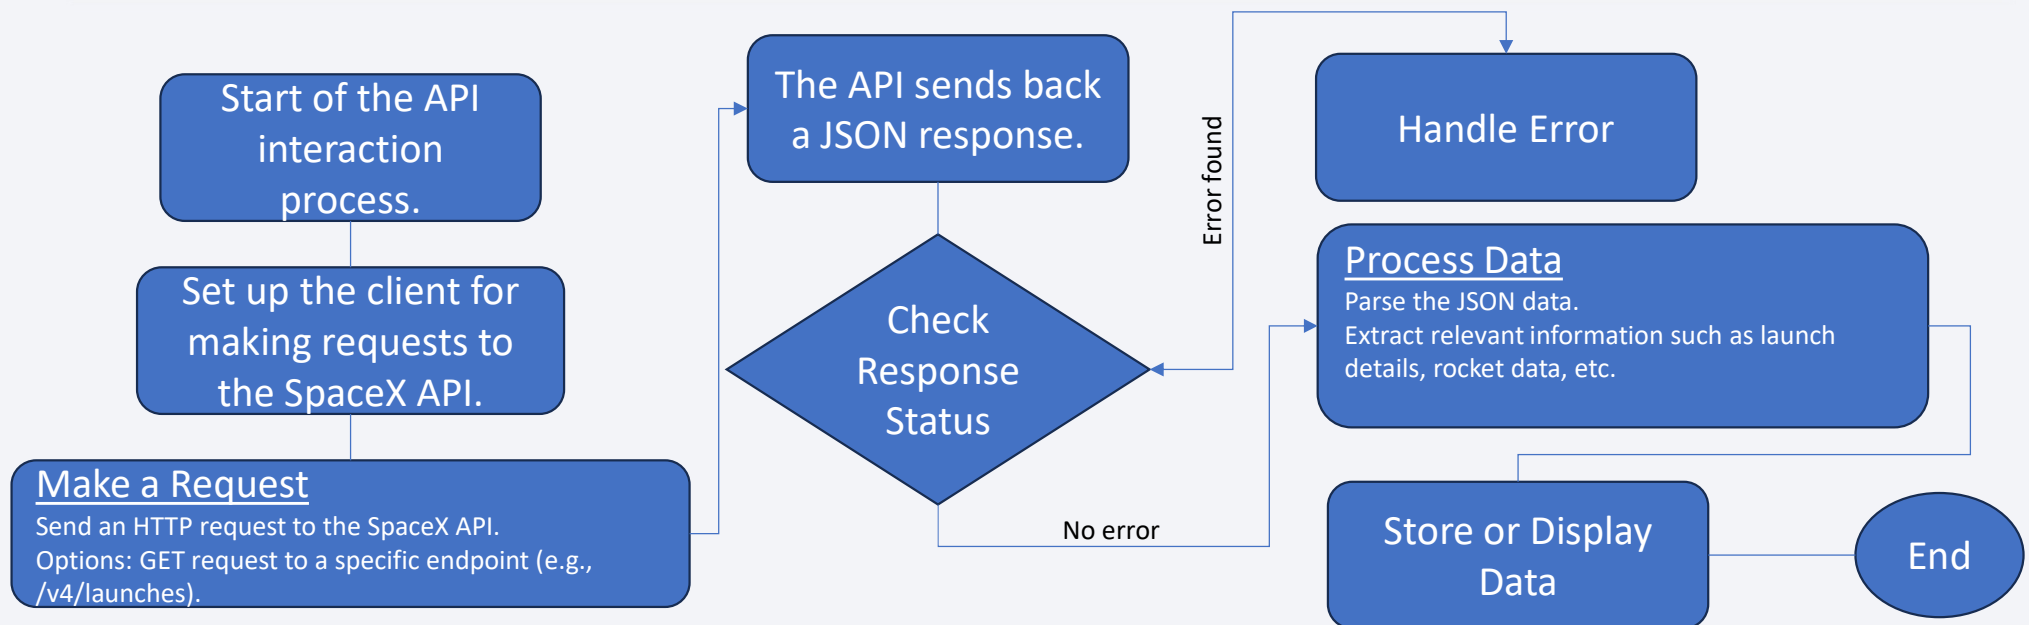

Executive Summary

- Data collection methodology:
 - Multiple sites on Internet used for getting the accurate and relevant data
- Perform data wrangling
 - Data set focused on Falcon 9 launches. So, the data has been filtered conveniently for reaching the accurate result. Key attention for rows with missing values in order to prevent/anticipate errors issues.
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - Machine learning prediction

Data Collection / Technical description

- Space X data source: [API call spacex api.json](#)
- Decoded the response content as a Json using `.json()` and turn it into a Pandas data frame `.json_normalize()`
- Applied `getBoosterVersion` function method to get the booster version
- Constructed our dataset using the data we have obtained. Combined the columns into a dictionary.
- Created the Pandas data frame from the dictionary
- Filtered the data in order to select only the **Falcon 9** launches (scope for this study)
- Use the API again to get information about the launches using the IDs given for each launch. Specifically we will be using columns `rocket`, `payloads`, `launch pad` and `cores`.

Data Collection – SpaceX API

- Check [this GitHub URL](#) of the completed SpaceX API calls notebook as an external reference and peer-review purpose

The background of the slide is an abstract composition. It features a solid blue area on the left side, which transitions into a complex pattern of diagonal streaks in shades of blue, red, and cyan on the right. These streaks have a textured, almost woven appearance. Overlaid on this pattern is a faint, light blue grid that recedes into the distance, creating a sense of depth and perspective.

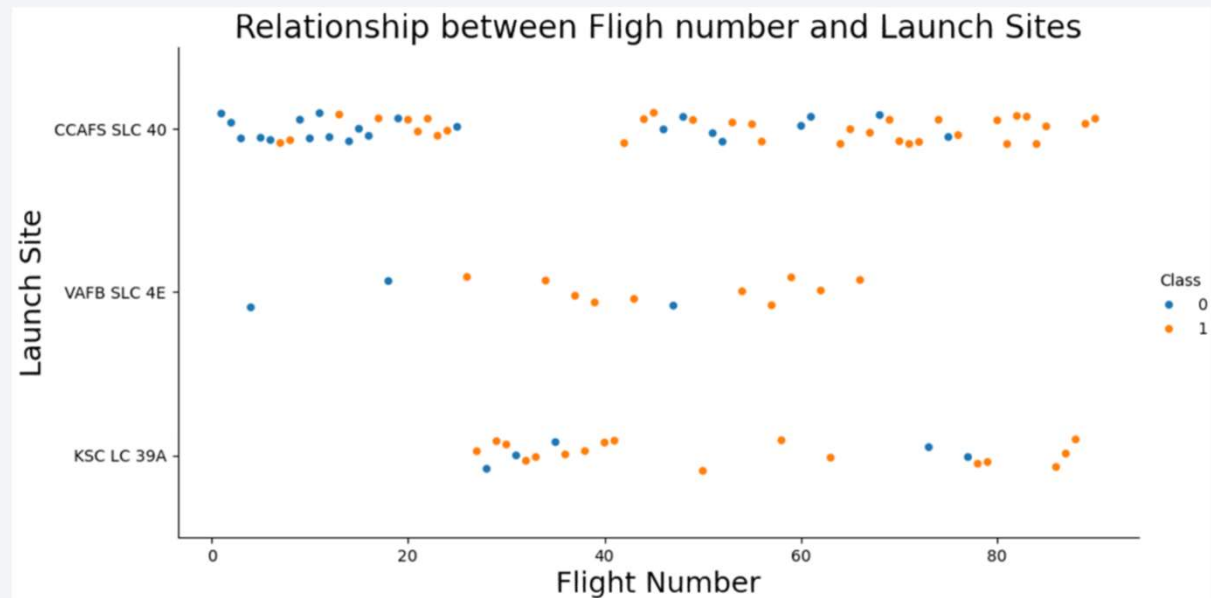

Section 2

Insights drawn from EDA

Flight Number vs. Launch Site

“Class” meaning:
1 = Success
0 = Failed

As we can see most of the releases have been read listed from the CCAFS SLC40 location as shown in the graph.

Payload vs. Launch Site

"Class" meaning:
1 = Success
0 = Failed

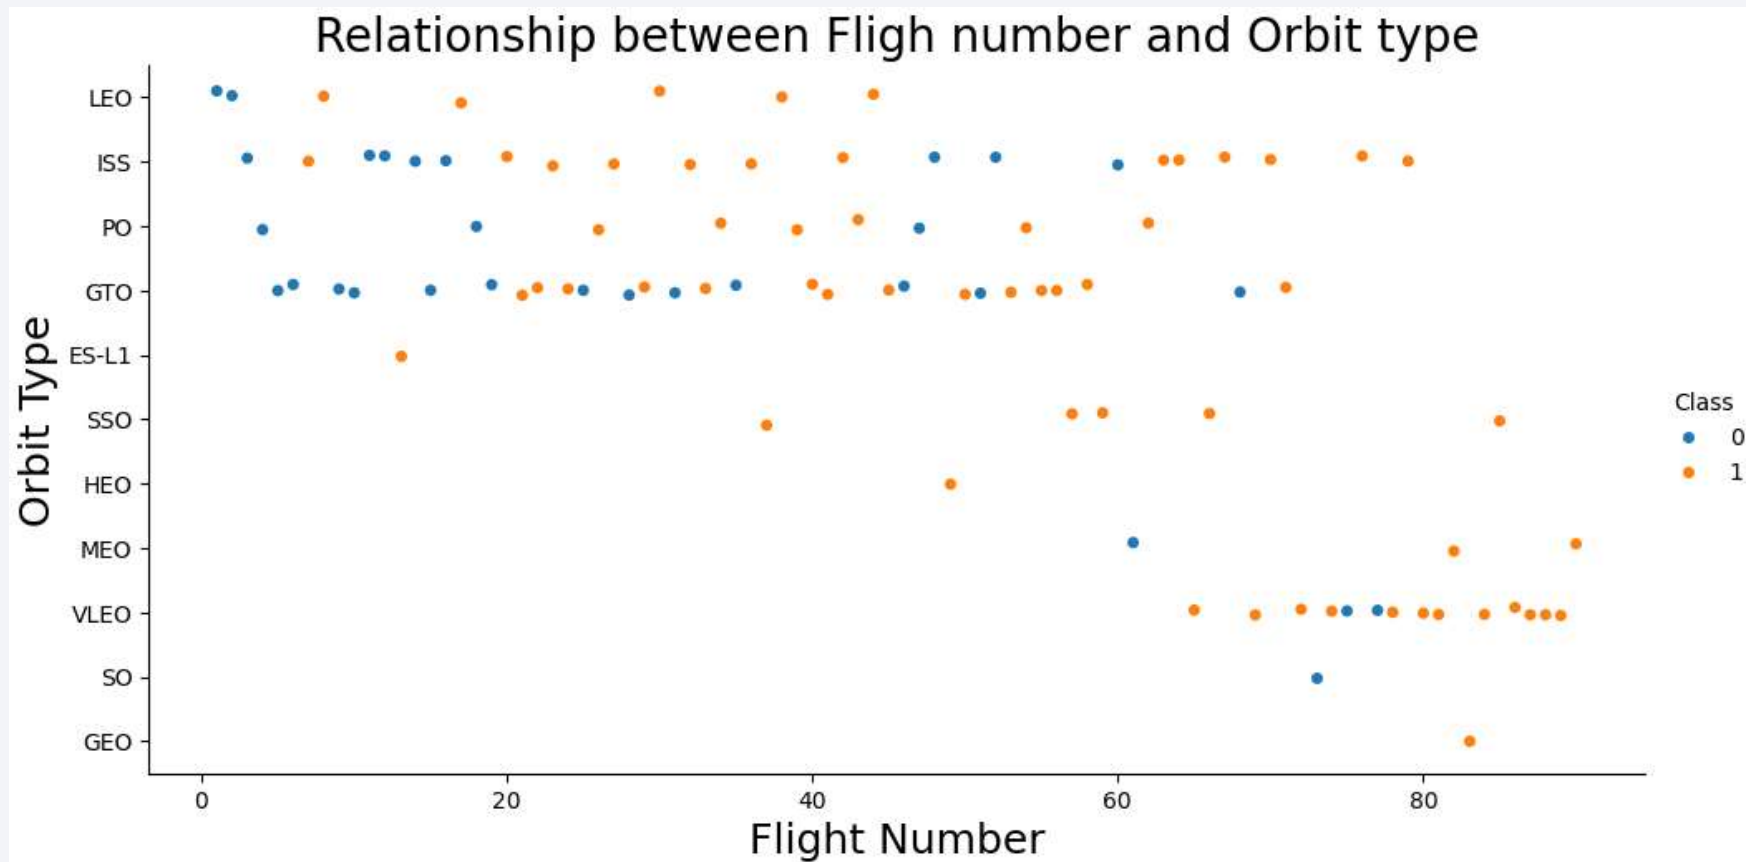

Success Rate vs. Orbit Type

We can see that there are four orbits with a 100% success rate which are the most recurrent as we can see in the next slide.

Flight Number vs. Orbit Type

"Class" meaning:
1 = Success
0 = Failed

Payload vs. Orbit Type

"Class" meaning:
1 = Success
0 = Failed

Mostly the maximum payload as shown in the graph has been up to 8000kg with a few cases with higher payloads.

In any case, with higher payloads than 8K we see that the failing cases are only two.

Launch Success Yearly Trend

Clearly, we can see that from 2013 onwards, the success rate is increasing year after year with the exception of 2018.

All Launch Site Names

- Check beside the result of different launch sites filtered accordingly
- The snipping shows the SQL sentence from the LAB used and which is the result

Display the names of the unique launch sites in the space mission

```
%sql SELECT DISTINCT "Launch_Site" FROM SPACEXTABLE;
```

```
* sqlite:///my_data1.db
```

Done.

Launch_Site
CCAFS LC-40
VAFB SLC-4E
KSC LC-39A
CCAFS SLC-40

Launch Site Names Begin with 'CCA'

- The snippet shows the SQL sentence from the LAB used according to the instructions

Display 5 records where launch sites begin with the string 'CCA'

```
%sql SELECT * FROM SPACEXTABLE WHERE Launch_Site like 'CCA%'LIMIT 5;
```

```
* sqlite:///my_data1.db
```

Done.

Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASS_KG_	Orbit	Customer	Mission_Outcome	Landing_Outcome
2010-06-04	18:45:00	F9 v1.0 B0003	CCAFS LC-40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
2010-12-08	15:43:00	F9 v1.0 B0004	CCAFS LC-40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
2012-05-22	7:44:00	F9 v1.0 B0005	CCAFS LC-40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attempt
2012-10-08	0:35:00	F9 v1.0 B0006	CCAFS LC-40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attempt
2013-03-01	15:10:00	F9 v1.0 B0007	CCAFS LC-40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attempt

Total Payload Mass

- The snippet shows the SQL sentence from the LAB used according to the instructions

Display the total payload mass carried by boosters launched by NASA (CRS)

```
%sql SELECT SUM("PAYLOAD_MASS_KG_") FROM "SPACEXTABLE" WHERE Customer="NASA (CRS)";
```

```
* sqlite:///my_data1.db
```

```
Done.
```

```
SUM("PAYLOAD_MASS_KG_")
```

```
45596
```

Average Payload Mass by F9 v1.1

- The snippet shows the SQL sentence from the LAB used according to the instructions

Display average payload mass carried by booster version F9 v1.1

```
%sql SELECT AVG("PAYLOAD_MASS_KG_") FROM "SPACEXTABLE" WHERE Booster_Version like "F9 v1.1%";
```

```
* sqlite:///my_data1.db
```

```
Done.
```

```
AVG("PAYLOAD_MASS_KG_")
```

```
2534.6666666666665
```

First Successful Ground Landing Date

- The snippet shows the SQL sentence from the LAB used according to the instructions

List the date when the first succesful landing outcome in ground pad was acheived.

Hint: Use min function

```
%sql SELECT MIN(Date) FROM SPACEXTABLE WHERE "Landing_Outcome" like "Success%";
```

```
* sqlite:///my\_data1.db
```

```
Done.
```

```
MIN(Date)
```

```
2015-12-22
```

Successful Drone Ship Landing with Payload between 4000 and 6000

- The snippet shows the SQL sentence from the LAB used according to the instructions

```
List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000

%sql SELECT Booster_Version FROM SPACEXTABLE WHERE "Landing_Outcome" = "Success (drone ship)" AND "PAYLOAD_MASS_KG_" BETWEEN 4000 AND 6000;

* sqlite:///my_data1.db
Done.
Booster_Version
F9 FT B1022
F9 FT B1026
F9 FT B1021.2
F9 FT B1031.2
```

Total Number of Successful and Failure Mission Outcomes

- The snippet shows the SQL sentence from the LAB used according to the instructions

List the total number of successful and failure mission outcomes

```
%sql SELECT COUNT(CASE WHEN Mission_Outcome like "Success%" THEN 1 END) AS total_success, COUNT(CASE WHEN Mission_Outcome like "Failure%" THEN 1 END) AS total_failure FROM SPACEXTABLE;
```

```
* sqlite:///my_data1.db
```

```
Done.
```

total_success	total_failure
100	1

Boosters Carried Maximum Payload

List the names of the booster_versions which have carried the maximum payload mass. Use a subquery

```
%sql SELECT Date, Booster_Version, PAYLOAD_MASS_KG_ FROM SPACEXTABLE WHERE "PAYLOAD_MASS_KG_" = (SELECT MAX("PAYLOAD_MASS_KG_") FROM SPACEXTABLE);
```

```
* sqlite:///my_data1.db
```

```
Done.
```

Date	Booster_Version	PAYLOAD_MASS_KG_
2019-11-11	F9 B5 B1048.4	15600
2020-01-07	F9 B5 B1049.4	15600
2020-01-29	F9 B5 B1051.3	15600
2020-02-17	F9 B5 B1056.4	15600
2020-03-18	F9 B5 B1048.5	15600
2020-04-22	F9 B5 B1051.4	15600
2020-06-04	F9 B5 B1049.5	15600
2020-09-03	F9 B5 B1060.2	15600
2020-10-06	F9 B5 B1058.3	15600
2020-10-18	F9 B5 B1051.6	15600
2020-10-24	F9 B5 B1060.3	15600
2020-11-25	F9 B5 B1049.7	15600

- The snippet shows the SQL sentence from the LAB used according to the instructions

2015 Launch Records | failure landing_outcomes

- The snippet shows the SQL sentence from the LAB used according to the instructions

List the records which will display the month names, failure landing_outcomes in drone ship ,booster versions, launch_site for the months in year 2015.

Note: SQLite does not support monthnames. So you need to use substr(Date, 6,2) as month to get the months and substr(Date,0,5)='2015' for year.

```
%sql SELECT CASE substr(Date, 6, 2) WHEN '01' THEN 'January' WHEN '02' THEN 'February' WHEN '03' THEN 'March' WHEN '04' THEN 'April' WHEN '05' THEN 'May' WHEN '06' THEN 'June' WHEN '07' THEN 'Jul'
```

```
* sqlite:///my_data1.db
```

```
Done.
```

Month_Name	Booster_Version	Launch_Site
------------	-----------------	-------------

January	F9 v1.1 B1012	CCAFS LC-40
---------	---------------	-------------

April	F9 v1.1 B1015	CCAFS LC-40
-------	---------------	-------------

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order.

```
%sql SELECT Landing_Outcome, COUNT(*) AS outcome_count FROM SPACEXTABLE WHERE Date BETWEEN '2010-06-04' AND '2017-03-20' GROUP BY Landing_Outcome ORDER BY outcome_count DESC;
```

```
* sqlite:///my_data1.db
```

```
Done.
```

Landing_Outcome	outcome_count
No attempt	10
Success (drone ship)	5
Failure (drone ship)	5
Success (ground pad)	3
Controlled (ocean)	3
Uncontrolled (ocean)	2
Failure (parachute)	2
Precluded (drone ship)	1

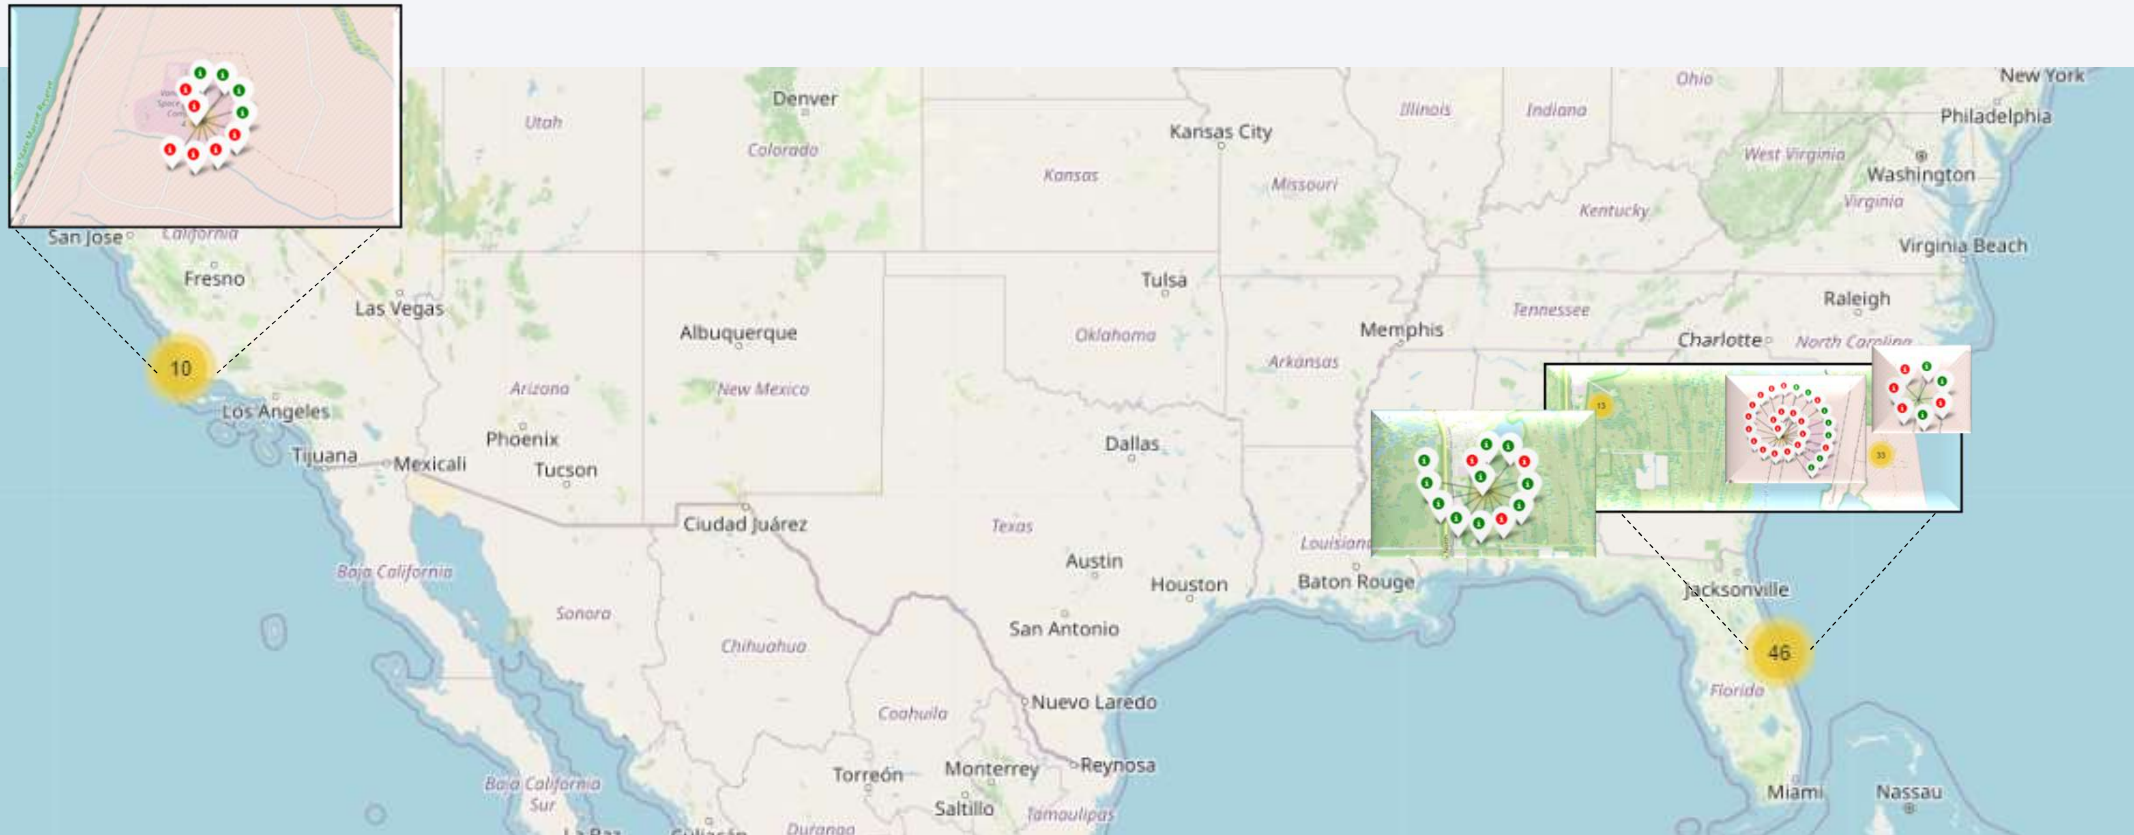

- The snippet shows the SQL sentence from the LAB used according to the instructions

A satellite view of Earth from space, showing the curvature of the planet and the glow of city lights at night. The image is used as a background for the title slide.

Section 3

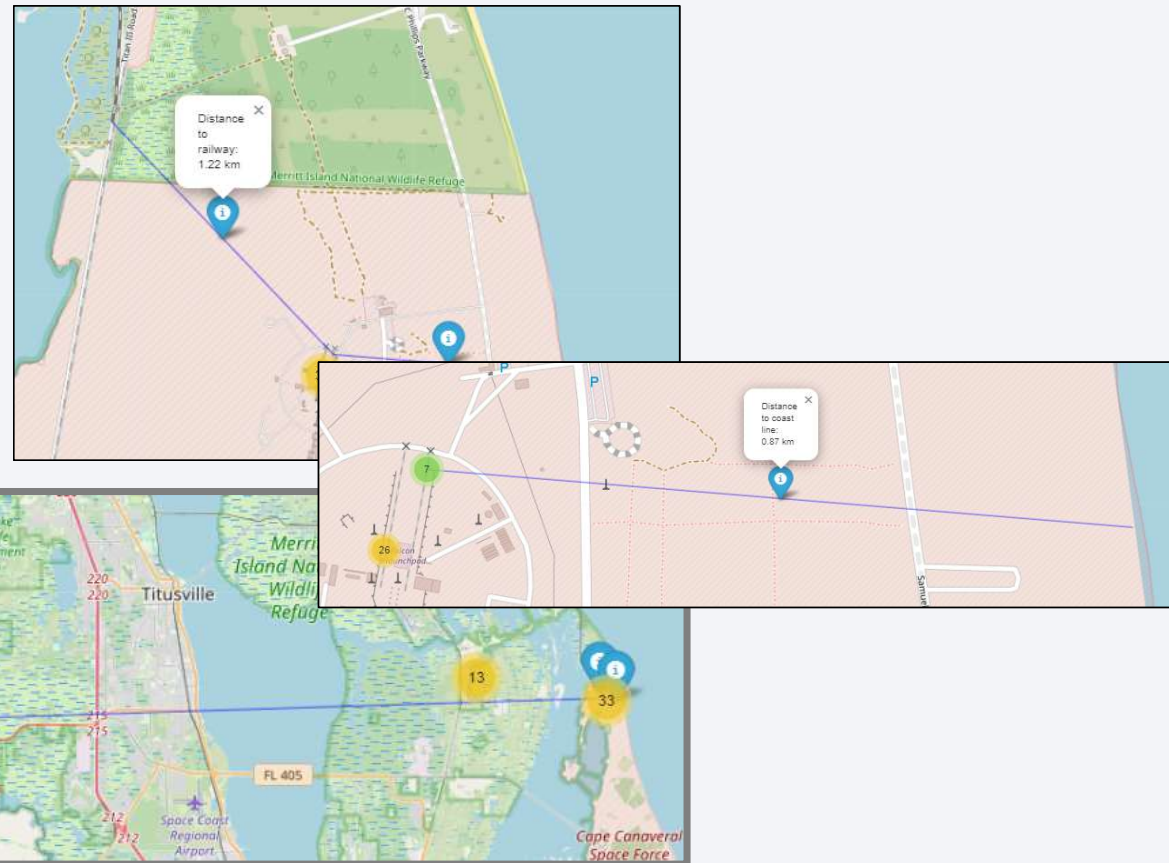

Launch Sites Proximities Analysis

Launch sites overview | success vs failed

Distances between a launch site to its proximities

Coast line (0,8Km), railway (1,22Km) and big city (79,44Km) distance taken for analyzing the key reasons (pros and cons.)

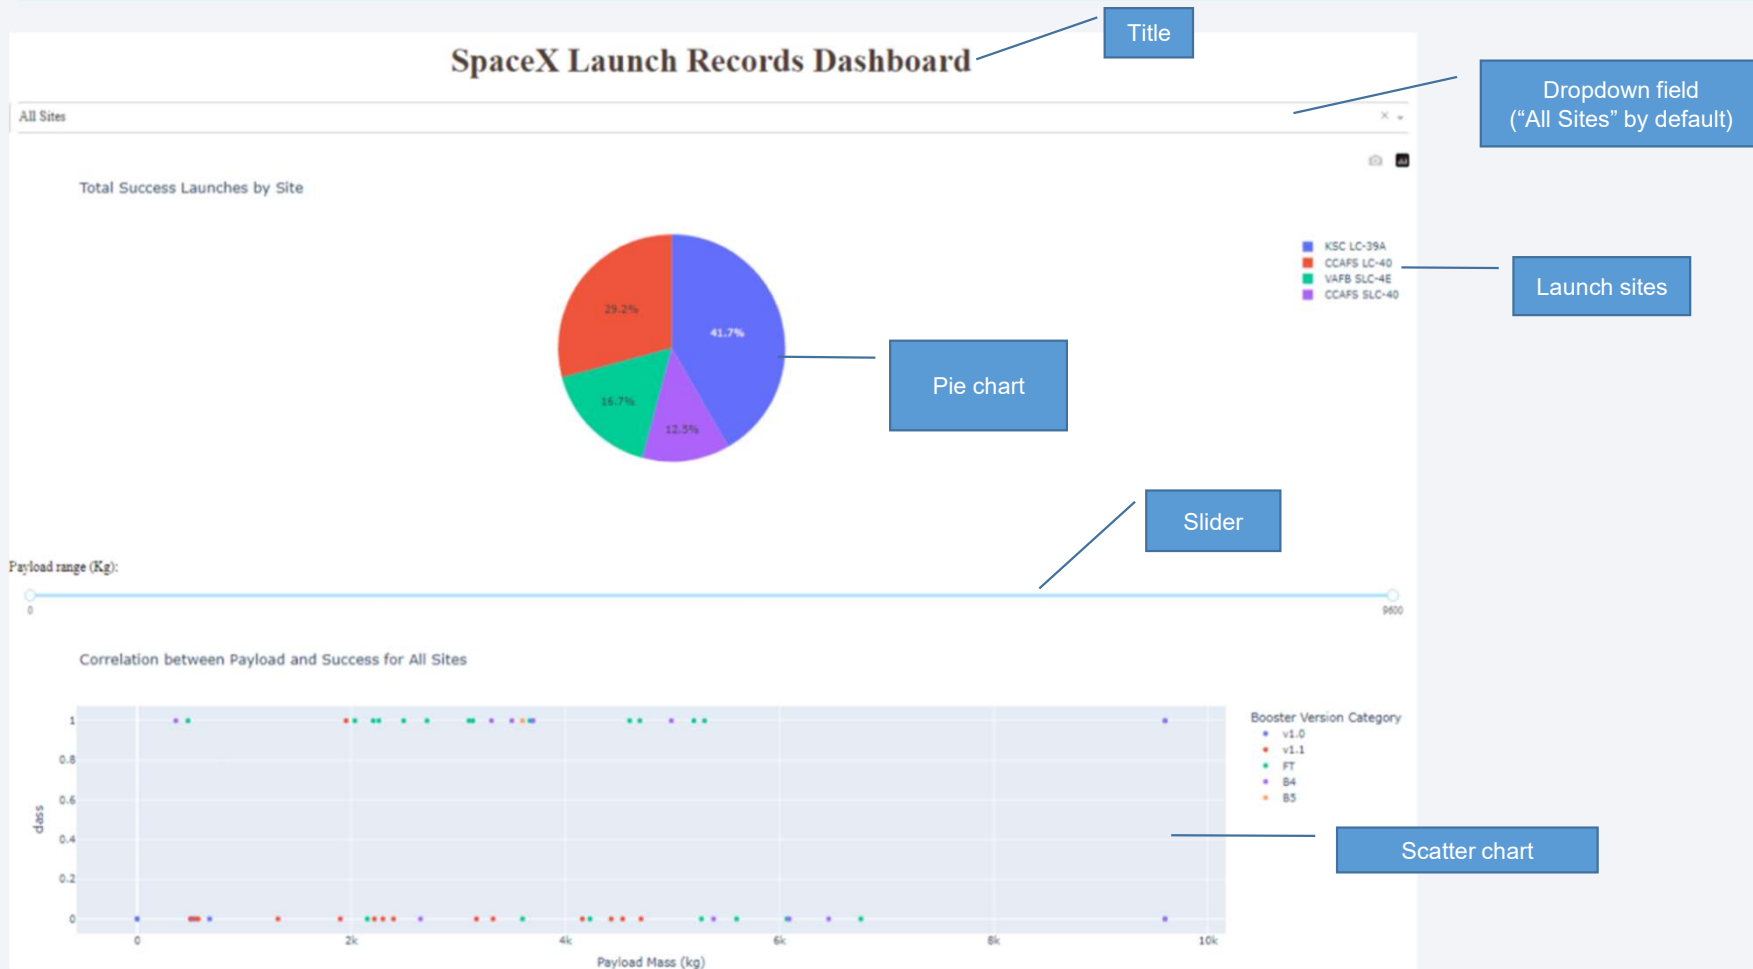

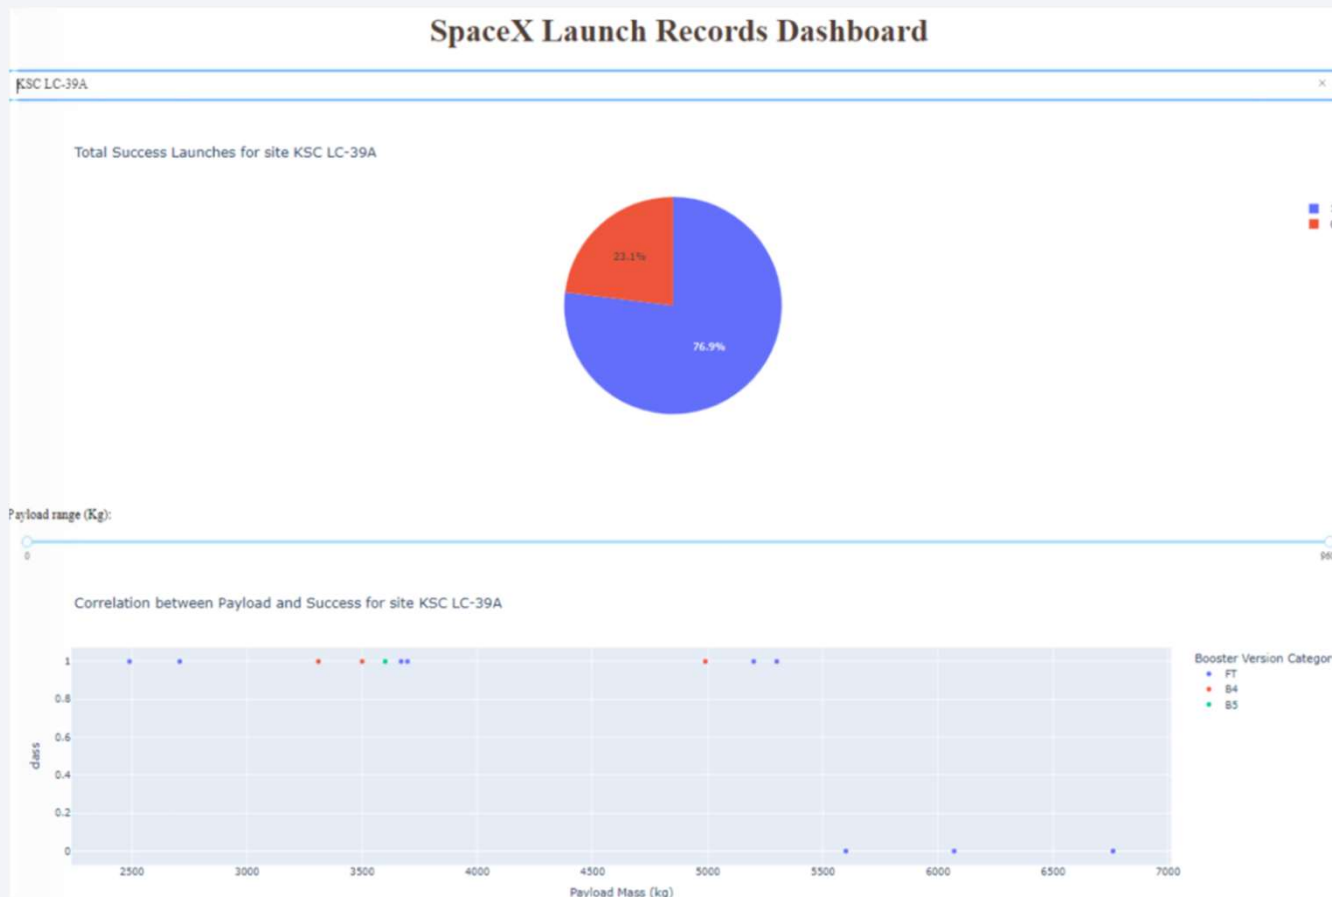

Section 4

Build a Dashboard with Plotly Dash

Dashboard main page (defaulted values)

Highest launch success ratio dashboard

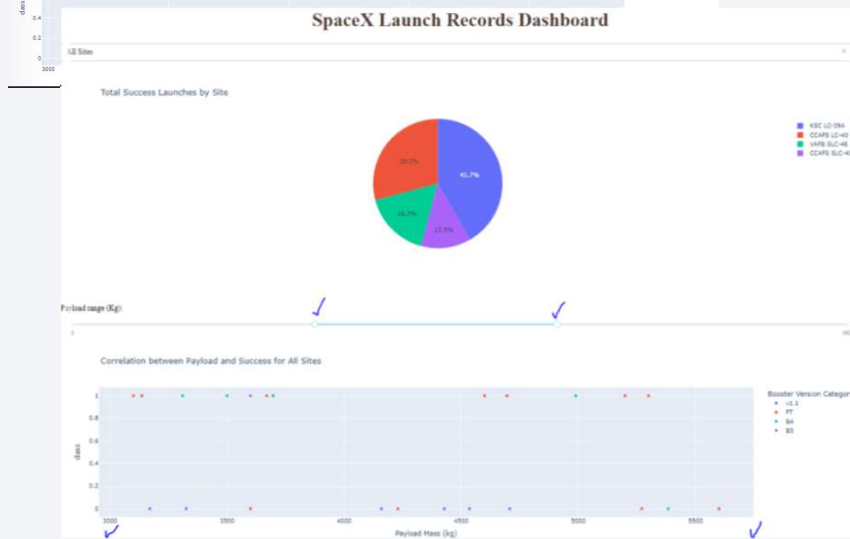

As showed in the dashboard, the launch site **KSC LC-39A** is the highest one from the "successful rating" (**76,9%**) perspective.

Let's note that all launched until 5500 kg payload are success meanwhile the three launches over this weight were unsuccessful.

Dashboard options

With **the slider** you can select the weights range you want to examine by determining the minimum and maximum weights, the latter being the maximum weight of all the records in our data set.

SpaceX Launch Records Dashboard

With the dropdown menu, you can select any launch site to analyze one by one its results, as well as all using the default option "All Sites".

Section 5

Predictive Analysis (Classification)

Classification Accuracy

Confusion Matrix

- Let's see the confusion matrixes as follows:

Note: for the SVM (only) the CV is 2 instead of 10 because the laptop performance issues got during the execution.

TASK 6

Create a support vector machine object then create a `GridSearchCV` object `svm_cv` with `cv = 10`. Fit the object to find the best parameters from the dictionary `parameters`.

```
parameters = {'kernel': ('linear', 'rbf', 'sigmoid'),
              'C': np.logspace(-3, 3, 5),
              'gamma': np.logspace(-3, 3, 5)}

svm = SVC()

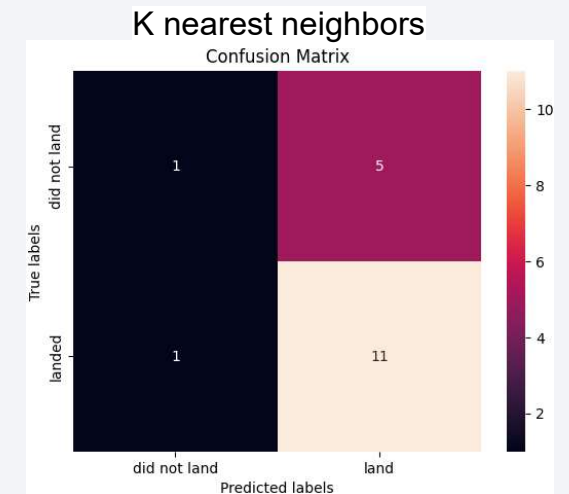

svm_cv = GridSearchCV(estimator=svm, param_grid=parameters, scoring='accuracy', cv=10, n_jobs=-1, verbose=1)
svm_cv.fit(X_train, y_train)
```

Fitting 2 folds for each of 75 candidates, totalling 150 fits

```
> GridSearchCV
  estimator: SVC
  > SVC
```

```
print("tuned hyperparameters (best parameters): ", svm_cv.best_params_)
print("accuracy: ", svm_cv.best_score_)

tuned hyperparameters (best parameters): {'C': 0.03162277660168379, 'gamma': 0.001, 'kernel': 'linear'}
accuracy: 0.8154646464646464
```

Conclusions

- Logistic Regression Test Accuracy: 0.8888888888888888
- Decision Tree Test Accuracy: 0.7777777777777778
- K-Nearest Neighbors Test Accuracy: 0.6666666666666666
- Logistic Regression Best CV Score: 0.7888888888888889
- Decision Tree Best CV Score: 0.8888888888888889
- K-Nearest Neighbors Best CV Score: 0.6333333333333334
- ✓ The best method based on test accuracy is: Logistic Regression
- ✓ The best method based on cross-validation score is: Decision Tree
